**1. Calculating the moving average of a time series of data using scala collection**

**Code:**

```
object Himanshu {  
  def main(args: Array[String]): Unit = {  
    val data = List(10, 20, 30, 40, 50, 60)  
    val windowSize = 3  
    val movingWindows = data.sliding(windowSize)  
    val movingAverages = movingWindows.map(window => window.sum.toDouble /  
window.size).toList  
    println(f"moving averages : $movingAverages")  
    println("Himanshu S037")  
  }  
}
```

**Output:**

```
moving averages : List(20.0, 30.0, 40.0, 50.0)  
Himanshu S037  
  
Process finished with exit code 0
```
